Notably, as more battery capacity has come online, a growing share is now being used to supply energy directly during peak hours rather than purely for grid balancing, reflecting how central

MIT engineers created a carbon-cement supercapacitor that can store large amounts of energy. Made of just cement, water, and carbon black, the device could form the basis for

New research emphasizes the importance of well-validated models and forecasting tools in evaluating choices for investments in clean energy technologies and policies by governments and

These technologies capture energy generated during non-peak times to be dispatched at the end of the day and into the evening as the sun sets and solar

A look at how AI can be used to help support the clean energy transition by helping to manage power grid operations, plan infrastructure investments, guide the development of novel

At the MIT Energy Initiative's Annual Research Conference, industry leaders agreed collaboration is key to advancing critical technologies amidst a changing energy landscape.

Battery energy storage systems are generally designed to deliver their full rated power for durations ranging from 1 to 4 hours, with emerging technologies

MIT Energy Initiative researchers calculated the economic and environmental impact of future ammonia energy production and trade pathways.

When fully charged, battery units built through 2020 could produce their rated nameplate power capacity for about 3.0 hours on average before recharging. Our Annual Electric Generator

MIT engineers developed a membrane that filters the components of crude oil by their molecular size, an advance that could dramatically reduce the amount of energy needed for crude oil

Energy storage battery times
