I am intending to install 2 solar panel arrays with different power outputs and I want each array to connect to the same identical controllers that will both connect to the same battery bank.

By the end of this article, you'll know what each solar component does--from panels and inverters to batteries, controllers, wiring, and mounting systems--and why it matters for your setup.

As @PeterShor points out, in this case "one" is the pronoun, and would never be numeric. Beyond that, as a general rule, spell out numbers 1-9, but for technical writing, it may be appropriate

Some people say a dog=one, dogs=ones, the dog=the one=that, and the dogs=the ones=those. It's a rule of thumb, but what I found was that this is not always correct.

The effective use of two solar controllers can significantly enhance the performance of a solar energy system. By carefully understanding each

This algorithm was successful in identifying the most important features that affected solar power generation, including weather conditions, time of day, and solar panel tilt angle.

The article discusses solar charge controllers, their function, types (PWM and MPPT), and the possibility of using multiple charge controllers with a

"Which one is the best" is obviously a question format, so it makes sense that "which one the best is" should be the correct form. This is very good instinct, and you could even argue that

With one or more is / are, the first thing to consider is whether "one or more" is a unit or analysable. It has the near-synonym "some"; "four or five" could be substituted reasonably by "several".

Regarding one hundred or a hundred etc, the person saying that there is a difference is right - one is used more for precision but a is more common and employed.
